

Rejuveness®

Heal Scars™

PRODUCT GUIDE

Rejuveness® is an integrated system of products for scar treatment based on the keloid wound healing model, which re-establishes the stratum corneum (top layer) of skin. This Product Guide will point customers in the right direction for choosing the right product for the type and location of the scar they wish to treat.

NON-ADHESIVE SILICONE SHEETING

Implantable-grade elastomer that you affix to the skin with tape or under tight garments for the prevention and management large or small keloid and hypertrophic scars. To be used for minimally invasive incisions, laparoscopic surgery, burns, breast surgery, tummy tucks, and other significant surgery. Sheeting can also minimize soreness, itching, discoloration, and lumpiness that often accompanies problem scarring.

HYPOALLERGENIC TAPE

This 100% cotton tape holds Rejuveness non-adhesive silicone sheeting firmly but gently in place with a hypoallergenic non-latex backing that is as flexible as natural skin. It provides optimal mechanical support for scar management, especially in treatment plans where extended wearing time and delicate removal is indicated. Can be used wherever medical tape is needed.

ADHESIVE SILICONE SHEETING

This strong, reusable, medical-grade elastomer confers the same benefits in scar treatment as our non-adhesive silicone sheeting, and can be used in many of the same situations. The only difference is that it comes with an adhesive backing that returns to full strength after each washing. Because it does not require tape, it is also less noticeable when worn under clothing.

HYPER-HEAL CREAM

Use for the re-establishment of a compromised stratum corneum in keloids, hypertrophic scars, and ablated skin. By restoring moisture retention of the upper layer of skin, this unique scar cream addresses the problem of "barrier disruption," which is a major symptom in problem scarring. Hyper-Heal replenishes and rebuilds the tissue from the inside out for flat, scar-less healing.

DERMA NEEDLING

Skin micro-needling (or derma rolling) is an increasingly common cosmetic procedure for treating many skin conditions by stimulating blood flow and collagen and elastin production. Use for all scar types, including hypotrophic (white) scars, as well as wrinkles, stretch marks, cellulite, skin dimpling, and discoloration. It is also effective in improving thinning hair and hair loss.
